

MySQL Database: What is my database server name?

On the Modwest grid hosting system, your database server will never be "localhost".

Instead, when you create a database in [OnSite](#), you will choose a database server. You will use that server name in your connections. Current valid database servers are:

- db0.modwest.com
- db1.modwest.com
- db2.modwest.com

You can see your current databases and their servers [here](#), when you log in as your administrative user.

Unique solution ID: #270
